GMC No : G-361

M.D. (Path)

GMC No : G-24070

Name : MASTER. SHAURYA G NAYAK

Pt. Id

Lab Ref No. : **L18657**

Ref. by : DR.SARBANI RAHA

Age / Sex : 4 Year(s) / Male

Reg. Date : 01/05/2026 16:20

Accession No. : 0

Reported On : 01/05/2026 19:24

NON FASTING

Report Status Final

HAEMATOLOGY (IMMUNOHAEMATOLOGY)

Specimen :

Coll.

WHOLE BLOOD EDTA, BG

01-05-2026 16:39: Lab Collection

Test Parameter

Result(s)

Biological Reference Interval (Adult)

Blood Group

Blood Group

B Rh Positive

(Gel technology -
Agglutination)

Test note

- This blood group has been done with new sensitive Gel Technology using both forward and reverse grouping.
- This method check's group both on Red cells and in Serum for "ABO" group. Also autoagglutination has been checked for.
- Test for group "O" Bombay phenotype is not done on routine basis. This however is available on specific request.

BIOCHEMISTRY

Specimen : Coll.
SERUM BIO 01-05-2026 16:38: Lab Collection

Test Parameter	Result(s)	Biological Reference Interval (Adult)
Creatine Kinase (CPK)		
CPK	(H) 22051 U/L	55 - 170 (Enzymatic)

Dilution used 1:20

Reference range for this age : 75 - 230

Test Note

CK is found predominantly in the heart muscle, skeletal muscle, and brain and are elevated when these muscle or nerve cells are injured. They can rise within 6 hours after damage and if damage does not continue, the levels peak at 18 hours after injury and return to normal in 2 to 3 days. Increased levels can be seen with diseases or injury affecting the heart muscle, skeletal muscle, and brain. Serum CK activity >1000 units/L helps to distinguish muscle disease from neurogenic causes of weakness and muscle atrophy. More modest elevation of CK may occur in some primary neurologic disorders, particularly motor neuron disease.

CK is a dimer molecule and occurs in three distinct isoenzyme forms (termed MM, MB, and BB), which can be distinguished electrophoretically. CK-BE fraction constitutes a negligible portion of total CK and increased levels may indicate diseases that affect the CNS. CK-MB fraction constitutes a minor portion of total CK and increased levels may indicate diseases that affect the heart. CK-MM constitutes a major portion of total CK with increased levels seen with rhabdomyolysis, muscular dystrophy, myositis, recent surgery, electromyography, IM injections, trauma, crush injuries, delirium tremens, malignant hyperthermia, recent convulsions, ECT, shock, hypokalemia, or hypothyroidism.
